

## HUMAN PATIENT SIMULATOR GENDER RETROFIT

Women account for nearly 20% of enlisted personnel, yet medical training is done primarily on male human patient simulators. Investing in additional manikins with female anatomy can be cost prohibitive. Sadly, female mortality rates from battlefield injuries are much higher than those for males.

The Center for Army Lessons Learned findings suggest significant hesitation by male medics occurs when treating chest and groin areas of the female. When women are injured, they may not be properly examined and diagnosed because of ingrained societal taboos. Because of this, medical personnel may react less quickly to the immediate medical needs of female patients in emergency situations.

The SIMETRI Gender Retrofit Kit (GRK) provides trainees an opportunity to learn the critical tasks and techniques required to treat anatomically correct female patients without requiring additional female simulators! The GRK consists of a female breast vest, female genitalia, wig and makeup supplies that create highly realistic tactualy and in appearance.

Our easy to follow instructions and makeup supplies will transform your Laerdal SimMan® 3G Manikin from a male patient to a female patient that is ready for immediate use within minutes without voiding the manikin warranty. All of the easy to install GRK components are constructed with state-of-the-art silicone and other synthetic tissues and are available in light, medium, and dark skin tones.

**WOMEN INCUR  
THE SAME INJURIES  
AS MEN —**

**TRAIN YOUR STAFF  
TO PROVIDE  
THE SAME CARE!**
